Hello,

Thank you for taking the time to look over my submission for Pulse Creative. All the images and code used to create the page live in this folder on my Github account and can be accessed at this link - https://graysonrandall.github.io/portfolio/Pulse-Creative-Coding-Test/Pulse-Creative-GraysonRandall.html

All of my experience using Content Management Tools in the past (HubSpot, WordPress, GoDaddy) have been on clients accounts, meaning that I do not have a personal WordPress account of my own. Because of that I did my work here, on my personal Github account. I hope that is acceptable. Just in case you'd like to see, I've add a file in this folder called 'Past Works', which has links and screenshots to my previous works done in CMS tools.

I've also added some notes at the bottom of this page, mostly about how I would have approached this project if I we're building it within a CMS.

Thanks again for your time,
- Grayson

Development Notes:

• All brand colors and fonts I would have set elsewhere in the CMS. For example, a lot of CM tools have settings where you globally choose the font and where you set brand colors so that they are a selectable option for the customer later on.

• Most CM tools have a widget or plugin for a mobile menu. I usually find that easiest to use, but in this case I put in something that works and was very quick and easy to do.

• Things like the navigation and footer I would have made into custom modules/widgets so that they can be reused on templates throughout the various pages in the site.

• The mobile/tablet top impact image that replaces the video is a screenshot I took of the video and is not Hi-Def. Of course in a IT environment I'd be able to get a cleaner image for that but I just wanted to point that out.
